DETAILED ACTION

Claims 1-9 and 12 are pending in this application. The examiner withdraws the 35
 U.S.C. 101 rejection issued to applicant's in light of the recent amendment to the claims.

Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all
 obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-9 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Birsan et al. (Patent No US 6,848,078 B1), hereinafter Birsan, in view of Tuma et al (A hands-on approach to teaching the basic OSI reference model, Journal: International Journal of Electrical Engineering Education, April 2000), hereinafter Tuma.
- 4. With respect to claim 1, Birsan discloses a method for determining deviations of an end-system message of modular structure generated in a hierarchically-structured end system of a telecommunications device (Abstract, lines 1-3) by comparison with a reference message (Column 5, lines 15-27) comprising the steps of: reading in a reference message (Column 8, lines 43-49), reading in an end-system message (Column 9, lines 10-17) generated in the end system, performing a message-structure analysis of the reference message (Column 8, lines 43-49), performing a message-structure analysis of the generated end-system message (Column 9, lines

Application/Control Number: 10/550,949

Art Unit: 2457

10-17), determining deviations of the end-system message from the reference message (Column 4, lines 37-57) based on a structure and values for parameters of structural units (Column 6, lines 30-41 and Column 7, lines 3-12; also See Figure 3, item (42) and (52)), and, outputting structural units deviating from the reference message indicating values of parameters of respective structural units (Column 6, lines 30-41 and Column 7, lines 3-12; also See Figure 3, item (42) and (52)) of the end-system message (Column 6, lines 43-47; Column 8, lines 58-59; also See Figure 3) generated in the end system (Column 9, lines 10-17).

Birsan does not disclose that the device is structured and based on an OSI reference model; containing information of different layers according to the OSI reference model; selecting a part of the generated end-system message.

However, Tuma discloses that the device is structured and based on an OSI reference model (Paragraph 1, Introduction, Page 1, of the NPL document; also see Figure 1.); containing information of different layers according to the OSI reference model (Paragraphs 1-6; Pages 1-7, of the NPL document, which discloses in detail what information each layer consists of); selecting a part of the generated end-system message (Paragraph 3, The Data Link Layer, Page 3; subparagraph 5).

It would have been obvious have been obvious to the person of ordinary skill in the art at the time of invention to combine the teachings of Birsan with the teachings of Tuma in order to provide the user with a more detailed comparison of messages and files by comparing the makeup of each message or file.

- 5. With respect to claim 2, Birsan discloses identical structural units of the reference message and of the end-system message generated in the end system output, wherein the structural units of the end-system message deviating from the reference message are output in a manner graphically distinguishable from the identical structural units (Column 6, lines 14-24).
- 6. With respect to claim 3, Birsan discloses structural units only present in the reference message are output in a manner graphically distinguishable from structural units other than the structural units only present in the reference message (Column 6, lines 14-24).
- 7. With respect to claim 4, Birsan discloses structural units only present in the generated end-system message are output in a manner graphically distinguishable from structural units other than the structural units only present in the generated end- system message (Column 6, lines 14-24).
- With respect to claim 5, Birsan discloses the structural units at least of the end-system
 message are output in a manner corresponding to a modular construction (Column 2, lines 5561).

9. With respect to claim 6, Birsan discloses the outputting is provided in a first region of a

deviating from the reference message (Column 2, lines 6-17).

- screen display (Column 6, lines 17-21; see also Figure 3).
- 10. With respect to claim 7, Birsan discloses the structural units of the end-system message are output in a second region with an indication of information regarding a data stream of the end-system message, wherein structural units deviating from the reference message are output in

a manner distinguishable from structural units of the second region other than the structural units

11. With respect to claim 8, Birsan discloses the structural units of the end-system message

are output in a third region with an indication of information of a data stream of the reference

message, wherein structural units deviating from the reference message are output in a manner

distinguishable from structural units of the third region other than the structural units deviating

from the end-system message (Column 2, lines 6-17).

12. With respect to claim 9, Birsan discloses a digital storage medium with electronically-

readable control signals, configured to co-operate with a programmable computer or digital

signal processor (Column 9, lines 18-25).

13. With respect to claim 12, Birsan discloses computer software product with program-code

means stored on a machine-readable data carrier, for the implementation of the method according

Application/Control Number: 10/550,949

Art Unit: 2457

to claim 1, when the software is run on a computer or a digital signal processor (Column 9, lines

Page 6

26-34).

Response to Arguments

14. Applicant's arguments with respect to claims 1-9 and 12 have been considered but are not

persuasive.

15. With respect to applicant's argument on page 6 of the instant arguments. Applicant's

contend that Birsan does not access internal messaging procedures. In response to applicant's

argument that the references fail to show certain features of applicant's invention, it is noted that

the features upon which applicant relies (i.e., internal messaging procedures) are not recited in

the rejected claim(s). Although the claims are interpreted in light of the specification, limitations

from the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26

USPQ2d 1057 (Fed. Cir. 1993).

16. With respect to applicant's further arguments located on page 7 and 8 of the instant

arguments. The examiner addresses these arguments above in the newly crafted rejections as

these arguments are solely based on applicant's newly amended claims.

Art Unit: 2457

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MARSHALL MCLEOD whose telephone number is (571)270-3808. The examiner can normally be reached on Monday - Thursday 6:30 a.m-4:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ario Etienne can be reached on (571) 272-4001. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
